appropos academy

Let’s start!

Please interrupt me if ...

- ... you have a question
- ... you want me to repeat something
- ... you need a break

appropos academy

iOS

What’s different?

appropos academy

Limitations

- Screen
- Energy
- Mobile Data
- Memory
- Input

Expectations

- Stability
- Performance
- Design
- Responsiveness
- Usability (HIG)

Swift

appropos academy

A New Language

*After Apple unveiled the Swift programming language, it quickly became one of the **fastest growing** languages in history. Swift makes it easy to write software that is incredibly **fast and safe** by design. Now that Swift is **open source**, you can help make the best general purpose programming language available everywhere.*

*For students, learning Swift has been a great introduction to modern programming concepts and best practices. And because it is now open, their Swift skills will be able to be applied to an even broader range of platforms, from **mobile** devices to the **desktop** to the **cloud**.*

- **The Swift Team** - https://docs.swift.org

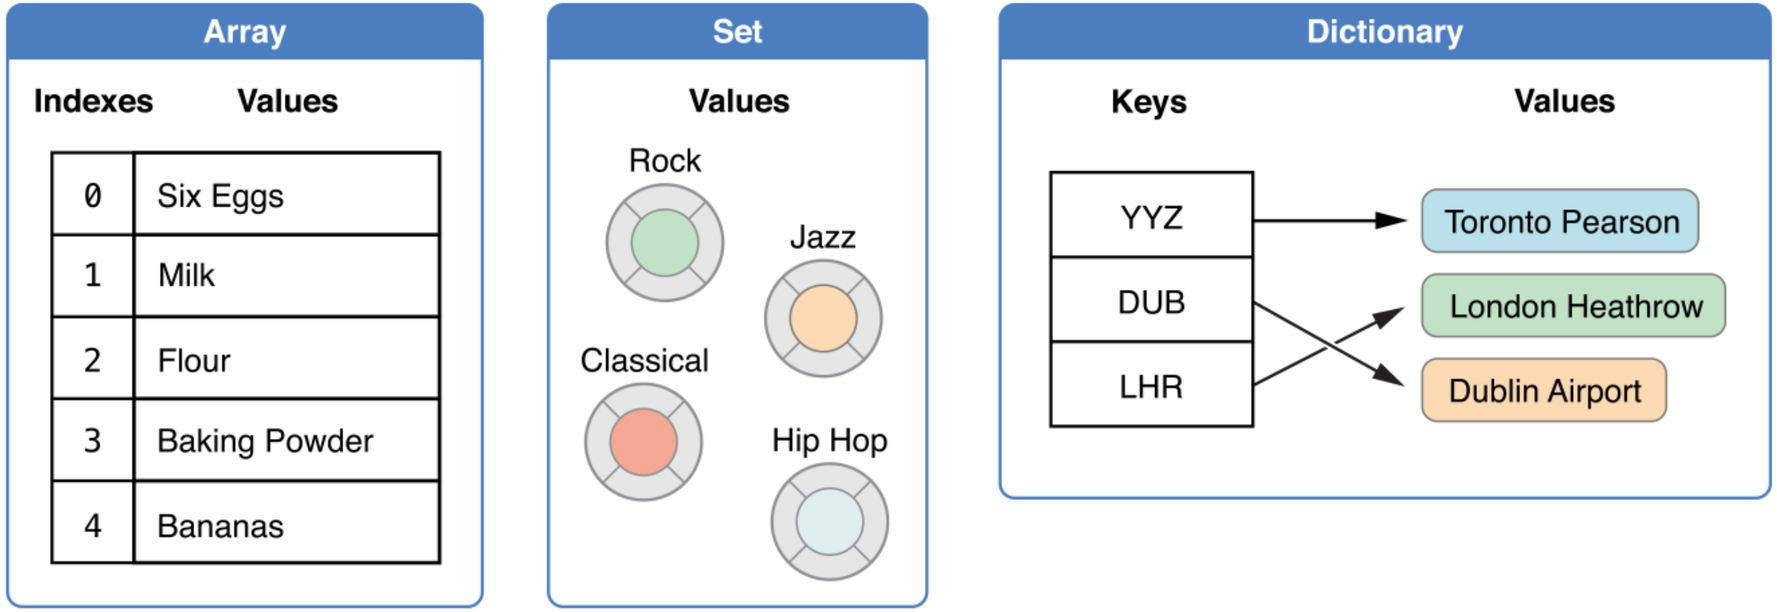
A Safe Language

Swift defines away large classes of common programming errors by adopting modern programming patterns:

- *Variables are always initialized before use*
- *Array indices are checked for out-of-bounds errors**
- *Integers are checked for overflow*
- *Optionals ensure that null values are handled explicitly*
- *Memory is managed automatically*
- *Error handling allows controlled recovery from unexpected failures*

- **The Swift Programming Language (Swift 5)** - https://docs.swift.org/swift-book/

Collection Types



The Swift Programming Language (Swift 4.2) https://docs.swift.org/swift-book/LanguageGuide/CollectionTypes.html

Apps

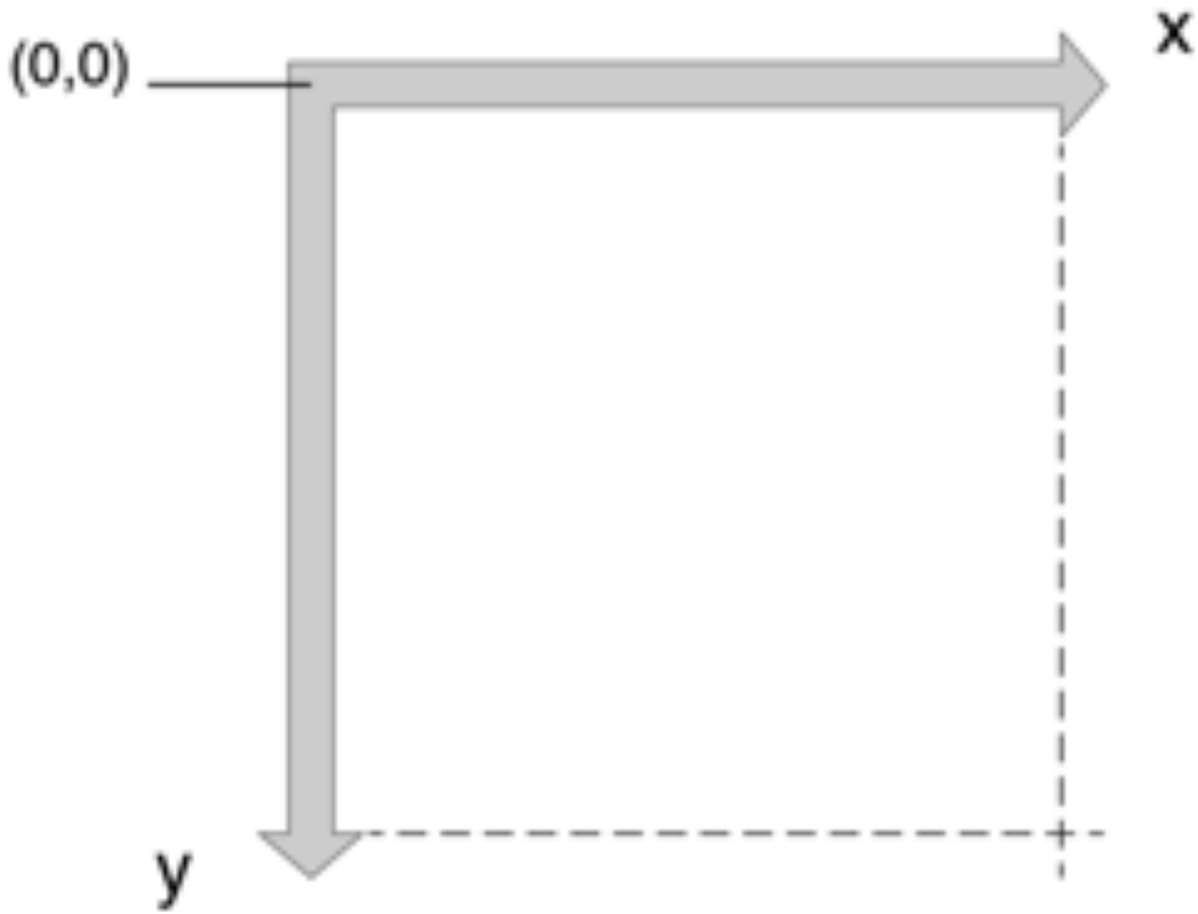
The UI Coordinate System



Drawing and Printing Guide for iOS https://developer.apple.com/library/archive/documentation/2DDrawing/Conceptual/DrawingPrintingiOS

Let’s code!

a very simple game

appropos academy

Exercise 1

- UIViewController with button and label
- Tapping the button appends a “!” to the label text

appropos academy

Exercise 2

- UIViewController with 3 **game buttons** and a start button
- Start button marks a random **game button** (by changing its text)
- Tapping a **game button** unmarks that button

Hint: Int.random(...)

appropos academy

Exercise 3

- UITableViewController with 5+ **game cells**
- Tapping a **game cell** marks it (by changing its text)
- Tapping it again unmarks it

Exercise 4

- Use a custom subclass of UITableViewCell for the **game cells**

appropos academy

Exercise 5

- Tapping can't mark **game cells**, only unmark them
- Repeatedly mark random **game cells**

Hint: Timer.scheduledTimer(...)

appropos academy

Exercise 6

- Random marking accelerates with every tap
- When all **game cells** are marked, a UIAlertController pops up

Hint: shorten interval by 5-10% per tap

appropos academy

Bonus Exercise

- Add an image to **game cells** that changes when marked
- Adjust Launch Screen and App Icon
- Save Highscores
- Show Elapsed Time

appropos academy

Dispatch Queues

Queues to which your application can submit executable blocks

- **Main queue**: highest priority, handles UI updates and events
- **Global queues**: universal queues shared by the whole system
  - 4 priority levels: high, default, low, and background

Concurrency Programming Guide https://developer.apple.com/library/archive/documentation/General/Conceptual/ConcurrencyProgrammingGuide/Introduction/Introduction.html

Dispatch Queues

Blocks can be scheduled in two ways:

- **Synchronously:** blocks the current thread until the block was executed
- **Asynchronously:** continues on the current thread and "forgets" about the block

Synchronously executing a block on the same queue creates a **deadlock**!

Synchronous scheduling from the main queue will **freeze the UI**!

Concurrency Programming Guide https://developer.apple.com/library/archive/documentation/General/Conceptual/ConcurrencyProgrammingGuide/Introduction/Introduction.html

Package Management

CocoaPods	Carthage	Swift Package Manager
old stable default option deeply integrated complex configuration	newer lightweight more manual steps not always supported repository = package	newest official well integrated **doesn't support iOS yet**

List of selected libraries: https://github.com/matteocrippa/awesome-swift

CocoaPods

- install CocoaPods (of not done yet)
- **`pod init`** (in project directory)
- list dependencies in the *Podfile* (pod '...')
- **`pod install`** (in project directory)
- always open the Workspace (.xcworkspace)

The iOS Platform

appropos academy

Hardware

Connectivity	Sensors	Other
• GSM/HSPA/LTE • WLAN • Bluetooth (BLE) • GPS • NFC*	• Face ID / Touch ID • Barometer • Three-axis gyro • Accelerometer • Proximity sensor • Ambient light sensor	• Camera • Speakers • 3D Touch

Software

Content	Graphics	Data
• WebKit • MapKit • ARKit • iAd	• Metal • OpenGL • SceneKit • SpriteKit	• CloudKit • EventKit • HealthKit • Core Data
Devices	**Other**	
• CoreBluetooth • iBeacon • WatchKit • HomeKit	• SiriKit • PassKit • Game Center • Core ML	• Core Motion • UserNotifications • AirPlay • StoreKit

Apple Developer Documentation https://developer.apple.com/documentation/

Distribution

Distribution Process

- Enroll into Apple Developer Program
- Create App Store listing (Bundle ID, Texts, Images, ...)
- Submit release build
- Review by Apple (automated + manual, up to 5 days)
- Approval, rejection or request for changes
- Publishing (up to 1 day until visible everywhere)

Code Signing
